Foreword

Neuroimaging Anatomy, Part 2: Head, Neck, and Spine

This is the second half of the wonderful two-part issue of Neuroimaging Clinics devoted to Neuroanatomy edited by Dr Tarik Massoud from Stanford University. The first half was devoted to brain and skull base anatomy. This issue is focused on head and neck and spine anatomy and comprises 13 beautifully written and illustrated articles.

Another heartfelt “Thank You” to Dr Massoud for editing this unique and wonderful contribution. As I mentioned in the foreword to the prior issue, Tarik not only accepted the invitation but also took this project to a new level. These wonderful issues would not be possible without the outstanding efforts of the article authors, and I want to personally thank these world-renowned experts for their wonderful contributions to this issue.

This two-part series has far exceeded Dr Massoud’s stated goal of presenting anatomic facts of practical value to neuroradiologists, neuroscientists, and their trainees. I will always refer to this two-part series when asked what I feel is the most comprehensive journal for reviewing radiologic neuroanatomy. Many thanks again to Tarik and the wonderful team for this lasting contribution!
